

Hi, I'm Luchen, in this video, I'm going to showcase you the web application our team built for VR1 Family..

So Before we made the request to the system, we need to create several objects.

First one is recipient detail. I will input zihan's information as the recipient.

We input the name, address, number members number, law partner, which is none

Then for private information, I will upload one id for demonstration.

Next we will input the donor information, here I will use my information as demo.

Again, we input name, age, mailing address phone number, email and preferred communication, and... ID

For organization donor, we will use university of melborune as a case.

We input the name, address, contact person and ABN

Next, we create the user-defined categories, let's say Canned Food Items, set the inventory as high. And we can also create a kit, let's use emergency food.

Next, let's create some items, say canned fish, we use the category and kit we just created.

Set the quantity as 100, enter the expired date, main ingredient and allergy information

And let's do the same thing to the item canned bean

Okay, well done to myself, now we are free to request something using all the information we just input. We can request the kit, we can also request the individual items based on the category.

And then, for the donors, we can record the item received from them based on the category. Select the item, make the note, and done.

For the optional use case, we create a separate component to use it as the marketing page, it will gives the site visitor a general understanding with VR1 family. And we can also naviage to the external social platform like facebook, or instgram.

Alright, thank you for watching, I will hand over the speech to the teams!
